

---

Carmen Goralski obtained her medical degree (MD) at the Medical University of Lublin in Poland where she was active in academic research in demyelinating neurological disorders. She presented this research at an international conference in Europe as a student. She later continued her academic research at Northwestern University's Lurie Children's Hospital where she was a part of some groundbreaking studies involving RNA Biosignatures, and also was a part of a trial that led to the FDA approving its first strain of a probiotic in a pediatric setting. She continued her journey into the industry and has been helping run clinical trials as a monitor for 7 years.

Dr. Goralski's physician level expertise focus has been on immunotherapy that began with the neurological autoimmune treatments that led to work in oncology treatments, and later on in vaccines. She has well-rounded experience in all parts of a trial as she has worked in different roles at both CROs and pharmaceutical companies.

In her free time, Carmen judges international science project competitions for the National Space Society.
